

RESPIRATORY SYNCYTIAL VIRUS (RSV)

FAST FACTS

Prepare for parenthood. Prepare for RSV.
All babies are at risk for RSV. Here are the Fast Facts.

1

RSV is most common during the winter virus season (November - March) but can vary by local areas.

2

RSV spreads when droplets from a cough, sneeze, or infected surface get inside the eyes, nose, or mouth.

3

2 out of 3 babies will get RSV by age 1.

4

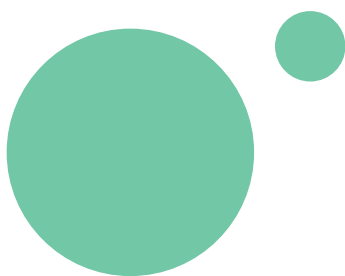

RSV can go from cold-like symptoms to hospitalization in less than a week.

5

Though hospitalization happens in only 1–2% of RSV cases, it's not predictable which baby will be hospitalized.

6

Babies are 16x more likely to be hospitalized with RSV than with the flu.
